

## Dangerous Goods

### Even everyday products can pose risks.

Some of the things we take to be harmless can potentially turn into hazardous on board an aircraft. That is why certain products and items that might endanger the lives or health of others may not be transported either in the cargo hold or the passenger cabin. To provide you with a guide, we have compiled a list of hazardous goods that may not be taken along under any circumstances:

- Explosives, such as ammunition and fireworks
- Propane gas canisters and other compressed, liquefied, pressurized and cryogenic gases
- Radioactive and oxidating substances and peroxides ( e.g., bleaches)
- Flammable solids and liquids, self-igniting and water-reactive substances (e.g., paints, coatings and thinners)
- Caustic solids and liquids (e.g., wet-cell batteries, mercury — also as part of equipment and instruments)
- Poisons such as insect sprays, infectious materials and environmentally harmful substances
- Lighters containing unabsorbed liquid fuel (exception: lighters with liquefied gas), lighter fluid and refill cartridges

#### **The following items are allowed only if certain precautions are taken:**

- Some battery-powered devices, especially diving and video lamps, may only be taken in carry-on luggage if the light source is removed and if the airline gives its express permission.
- You may only carry gas lighters and matches on your body.
